

HHP-2550

This pusher is designed for general-purpose oil seals with axes, and can be adjusted to accommodate inner diameters of 25 to 50. The size can be adjusted simply by twisting the chuck section. A molded cover is provided to protect the shaft surface (consumable item). This tool can also be used for pushing small-diameter bearings.

- * If the seal has been installed in a deep location, the base of the chuck may interfere with the surrounding area, making it impossible to use the tool even if the diameter is within the applicable range.
- * This tool is basically designed for oil seals. If used with bearings and other components, the chuck may be damaged if enough force is applied with a hammer to crush the dolly block.

- * The tool can be adjusted freely to match the outer diameter of the seal (within the applicable range), simply by twisting the chuck section.
